

Non-destructive Tests of Anchors

Amended Guidance

Guidance for the Survey and Construction of Steel Ships Part L

Reason for Amendment

The Guidance for the Survey and Construction of Steel Ships Part L specifies that the non-destructive tests of anchors are to be conducted during manufacturing. However, even though said Guidance does specify the type of the non-destructive test and the range of application it does not clearly specify the testing procedures and acceptable criteria. Therefore, the Society has been evaluating to approve products on an individual basis based upon the testing procedures preliminary examined.

Accordingly, all relevant requirements have been amended in order to clarify the testing procedures and acceptable criteria of the non-destructive tests of anchors.

Outline of Amendment

Requirements related to the testing procedures and acceptable criteria of non-destructive tests have been added.
